RELIABLE DAIRY SUPPLEMENT FOR PIGLETS

Denkapijg Lactosafe

Piglets of large litters often show a considerable variation in birth weight. The heaviest and strongest piglets will find a good teat and drink enough milk. The smaller and weaker piglets which need sow milk most are often deprived. In order to prevent starvation, such piglets need a supplementary milk to survive and to grow properly. Denkapijg Lactosafe piglet milk has a special composition to supplement sow's milk from the second day of life until 5 days before weaning. Mortality due to starvation and overlay can be drastically reduced.

Support of sow condition

For maintenance the sow has to consume a quantity of feed which represents approx. 1% of her own body weight (2-2.5 kg). For sufficient milk production some 0.4 kg of sow feed per piglet is additionally needed. This means that in case of an average litter size of 10 piglets a daily intake of over 6 kg of sow feed is required. Many sows will not be able to consume such a quantity of feed, especially in hot climates. The outcome will be insufficient milk production and loss of condition. Supplying the piglets with Denkapijg Lactosafe will prevent the sow from being suckled down too much. Therefore the condition of the sow will be better at weaning, resulting in improved fertility and subsequent litter size.

Colostrum

Denkapijg Lactosafe can not replace colostrum. The intake of colostrum is essential to provide the necessary immunoglobulins to induce resistance against disease. It is essential that the piglets have already had sufficient colostrum before Lactosafe is offered starting from 2-3 days of age.

Combining with creep feed

In addition to Denkapijg Lactosafe a high quality creep feed has to be offered separately as from 14 days of age. During the last 5 days before weaning only creep feed is offered, to stimulate the intake of dry feed, which is necessary in order to reduce post weaning setbacks.

Properties Denkapijg Lactosafe

- Pleasant odour
- Excellent taste stimulating high intake
- Rich in easily digestible energy
- Easily soluble in cold or tepid water
- High safety due to acidification
- Stimulation of feed intake after weaning

Mixing instructions

To prepare one litre of piglet milk, add approximately 0.9 litre of water to 150 gram of Denkapijg Lactosafe. Mix thoroughly using a whisk. It is recommended to mix and supply the milk twice a day and feed it ad lib. Make sure that the piglets have free access to fresh and clean water and to a sufficiently warm creep area.
